

# **Determination of optimized frequency and frequency ratio** values from over-determined sets of clock comparison data

Helen Margolis and Patrick Gill

# **Optical clocks and the SI second**

- Optical clocks have now reached levels of stability and accuracy that surpass the performance of the best caesium fountain primary standards.
- This raises the prospect of a future **redefinition** of the SI second.
- Optical clocks can already be used as **secondary** representations of the second.
- CIPM recommended frequencies and uncertainties [1] are assigned by the CCL-CCTF Frequency Standards Working Group (WGFS).
- Almost all data considered so far comes from absolute frequency measurements of optical clocks relative to caesium primary standards.
- However future information about the reproducibility of optical clocks will come mainly

# **Optical frequency ratio measurements**

- Within the ITOC project [2], a coordinated programme of clock comparisons will lead to
  - 1) a set of frequency ratio measurements between all high accuracy optical clocks being developed in European NMIs;
  - 2) a comprehensive set of absolute frequency measurements with uncertainties at the limit set by caesium primary standards.
- This complete set of measurements will be over-determined, in the sense that it will be possible to deduce some of the frequency ratios from several different measurements.
- New methods are required for analysing such over-determined sets of clock comparison data.

from direct optical frequency ratio measurements.

# **Analysis procedure**

- This is based on the approach used by CODATA to provide a self-consistent set of internationally recommended values of the fundamental physical constants [4].
- The software has been tested by using the same input data considered by the WGFS in deriving the CIPM recommended frequency values.

**Input**: Set of *N* measured frequency ratios  $q_i$ with variances  $u_i^2$  and covariances  $u_{ii}$ 

For  $N_{\rm S}$  different frequency standards (ion or atom species) with frequencies  $v_k$ , choose a set of  $M = N_S - 1$  adjusted frequency ratios  $z_i$ , where  $z_1 = v_1/v_2$ ,  $z_2 = v_2/v_3$ , ...

Express measured frequency ratios in terms of the adjusted frequency ratios, yielding a set of *N* equations, e.g.  $q_1 = v_1/v_4 = z_1z_2z_3$  etc.

 Algorithms have been implemented in Matlab.

• Numerical accuracy is ensured by using the hpf class [5].

Transitions included in analysis:							
Atom/ion	Transition						
<sup>115</sup> In <sup>+</sup>	5s <sup>2</sup> <sup>1</sup> S <sub>0</sub> – 5s5p <sup>3</sup> P <sub>0</sub>						
<sup>1</sup> H	$1s {}^{2}S_{1/2} - 2s {}^{2}S_{1/2}$						
<sup>199</sup> Hg	6s <sup>2</sup> <sup>1</sup> S <sub>0</sub> – 6s6p <sup>3</sup> P <sub>0</sub>						
<sup>27</sup> Al <sup>+</sup>	3s <sup>2</sup> <sup>1</sup> S <sub>0</sub> – 3s3p <sup>3</sup> P <sub>0</sub>						
<sup>119</sup> Hg <sup>+</sup>	5d <sup>10</sup> 6s <sup>2</sup> S <sub>1/2</sub> – 5d <sup>9</sup> 6s <sup>2</sup> <sup>2</sup> D <sub>5/2</sub>						
<sup>171</sup> Yb <sup>+</sup>	6s <sup>2</sup> S <sub>1/2</sub> – 5d <sup>2</sup> D <sub>3/2</sub>						
<sup>171</sup> Yb <sup>+</sup>	$6s^{2}S_{1/2} - 4f^{13} 6s^{2} F_{7/2}$						
<sup>171</sup> Yb	$6s^2 {}^{1}S_0 - 6s6p {}^{3}P_0$						
<sup>40</sup> Ca	$4s^{2} {}^{1}S_{0} - 4s4p {}^{3}P_{1}$						
<sup>88</sup> Sr <sup>+</sup>	5s <sup>2</sup> S <sub>1/2</sub> – 4d <sup>2</sup> D <sub>5/2</sub>						
<sup>88</sup> Sr	$5s^2 {}^{1}S_0 - 5s5p {}^{3}P_0$						
<sup>87</sup> Sr	$5s^2 {}^{1}S_0 - 5s5p {}^{3}P_0$						
<sup>40</sup> Ca <sup>+</sup>	$4s {}^{2}S_{1/2} - 3d {}^{2}D_{5/2}$						
<sup>87</sup> Rb	$5s^{2}S_{1/2}(F=1) - 5s^{2}S_{1/2}(F=2)$						
<sup>133</sup> Cs	$6s^{2}S_{1/2}(F=3) - 6s^{2}S_{1/2}(F=4)$						

optical-microwave frequency ratios).

**Correlations between the measured** quantities are included in the analysis.

# **Results obtained from existing data**

- The analysis software reproduces the 2013 CIPM recommended frequency values.
  - The sole exception is for <sup>40</sup>Ca (for which the WGFS used an unweighted mean).
- The uncertainties determined using the analysis software are smaller than the uncertainties of the CIPM values.
  - The WGFS takes a conservative approach to estimating uncertainties

# Importance of correlations

- Consider the hypothetical 10-day measurement campaign illustrated.
- Each optical clock runs 60% of the time.
- For the 6 measured frequency ratios, there are 12 non-zero correlation coefficients.
- Correlations arise from both statistical and systematic uncertainties.
- Correlation coefficients are estimated based on the present stabilities and systematic uncertainties of NPL's clocks.

because values are typically derived from only a few independent measurements.

**Frequency values obtained for the seven** optical secondary representations of the second

- The inclusion of new data in the analysis shows the wisdom of this approach.
- These methods were used by the WGFS to update the list of recommended frequency values in September 2015 (but with expanded uncertainties).

For arbitrarily-selected values of the measured frequency ratios, the effect on the optimized frequency ratios and absolute frequencies can be determined.

Yb<sup>+</sup> E3 / Sr<sup>+</sup>

- Neglecting correlations leads to too much weight being given to these measurements.
- This results in biased frequency values and underestimated uncertainties.
- Even stronger correlations could potentially arise for some planned measurement campaigns.

More information is required about the correlations between the input data **Conclusion**: (for both intra-laboratory and inter-laboratory comparisons)

EMRP

he EMRP is jointly funded by the EMRP participating countries within EURAMET and the European Unior

This work was funded by the European Metrology Research Programme as part of the project "International timescales with optical clocks" (ITOC). The EMRP is jointly funded by the EMRP participating countries within EURAMET and the European Union.
